Basic Vector Math

Basic Vector Math

Unity uses space geometry

Almost everything has a position in 3D space

We need points and vectors

Point: A position in space

Vector: A direction in space

Let's start with 2D

When you do Vector Math in Unity

[Vector3 struct](#)

Basic Vector Math

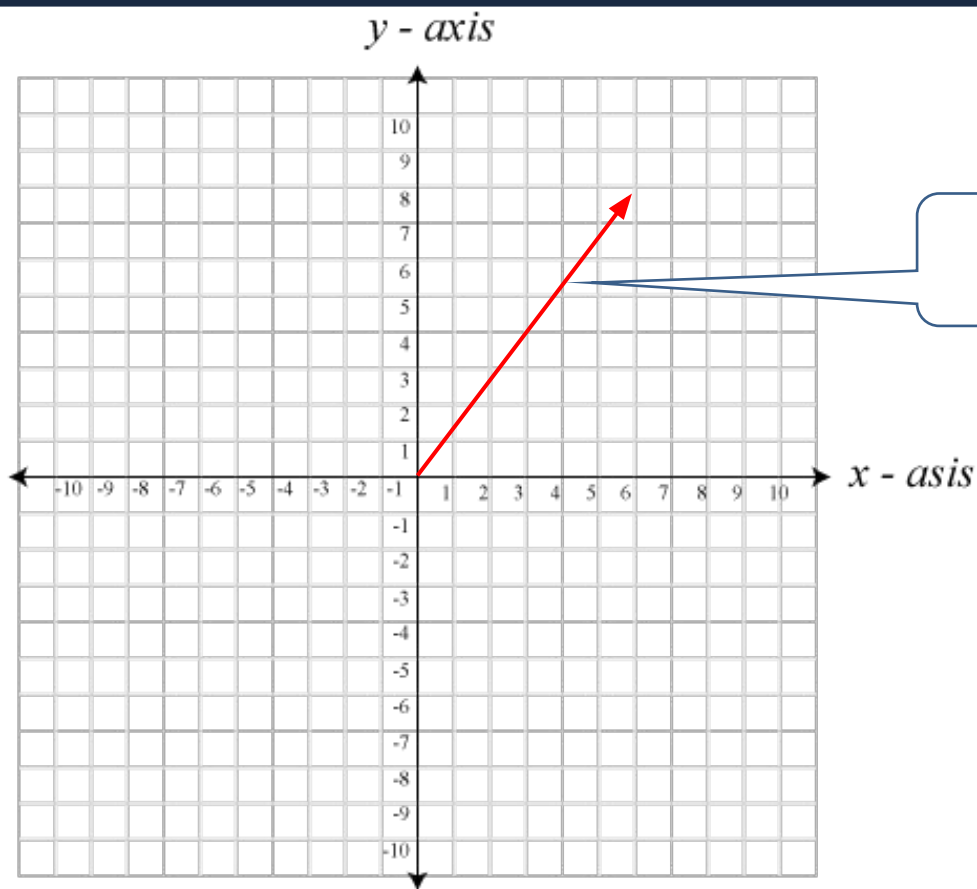

Basic Vector Math

Point: (6, 8)

Basic Vector Math

Basic Vector Math

Vector: $(6, 8)$

We can say:

A point is a position

A vector points to a position

Vector Addition

Adding vectors

$$a = (3, 4)$$

$$b = (3, 1)$$

$$a + b = v$$

$$\begin{pmatrix} 3 \\ 3 \end{pmatrix} + \begin{pmatrix} 4 \\ 1 \end{pmatrix}$$

$$v = (6, 5)$$

Vector Subtraction

Subtracting vectors

$$a = (3, 4)$$

$$b = (2, 7)$$

$$a - b = v$$

$$\begin{bmatrix} 3 & 4 \\ 2 & 7 \end{bmatrix} -$$

$$v = (1, -3)$$

Vector Subtraction

Subtracting vectors

$$a = (3, 4)$$

$$b = (2, 7)$$

$$a - b = v$$

$$\begin{bmatrix} 3 \\ 2 \end{bmatrix} - \begin{bmatrix} 4 \\ 7 \end{bmatrix}$$

$$v = (1, -3)$$

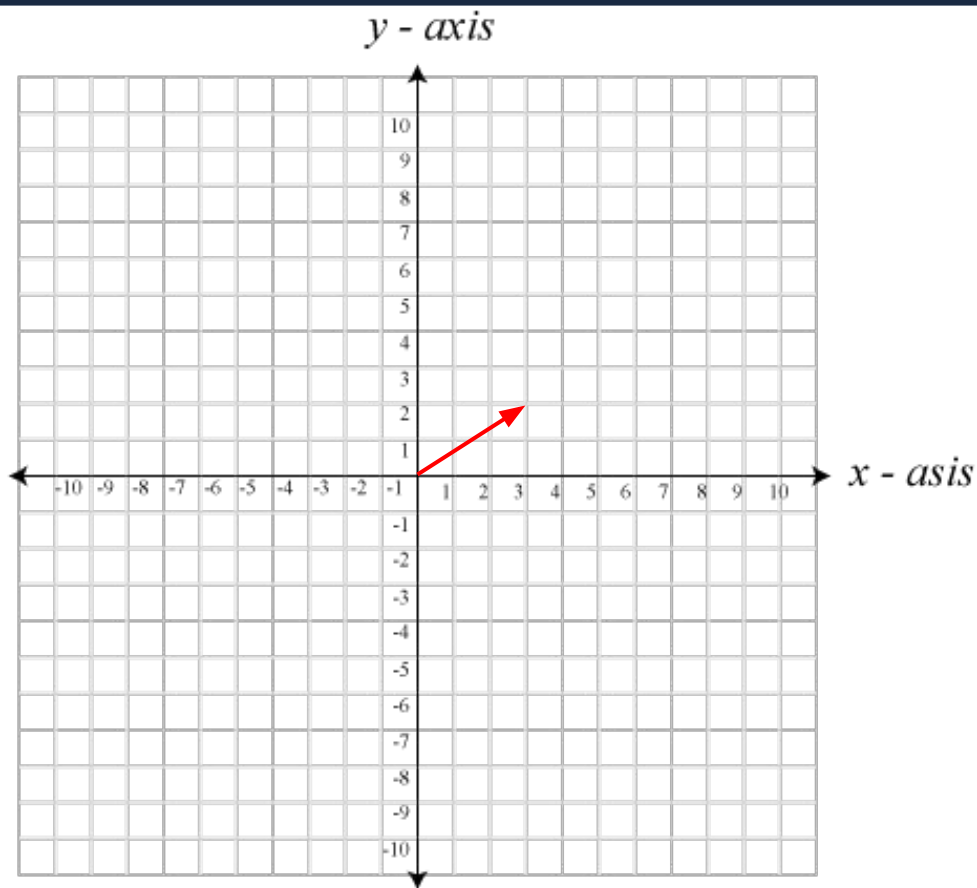

$$a + \text{reverse of } b \rightarrow (-2, -7)$$

Direction from Point A to Point B

- We have two points, **a** and **b**
- How do I figure out the direction from **a** to **b**?
- “to minus from”
- The ‘to’ point is **b**, the ‘from’ point is **a**.
- I.e.: $\mathbf{b} - \mathbf{a} = \text{dir}$
- $(10, 8) - (3, 3) = (7, 5)$

Vector Scaling

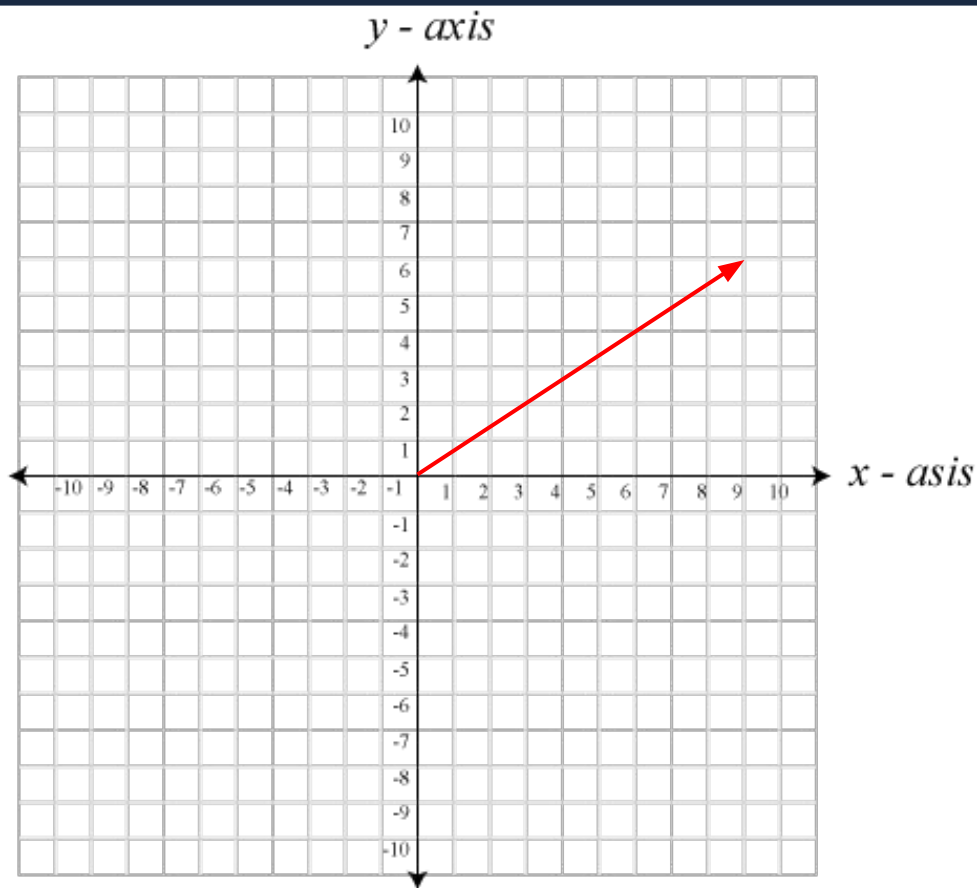

Scaling vectors

$$a = (3, 2)$$

$$a * 3$$

$$a * 3 = (3, 2) * 3 = (9, 6)$$

Vector Scaling

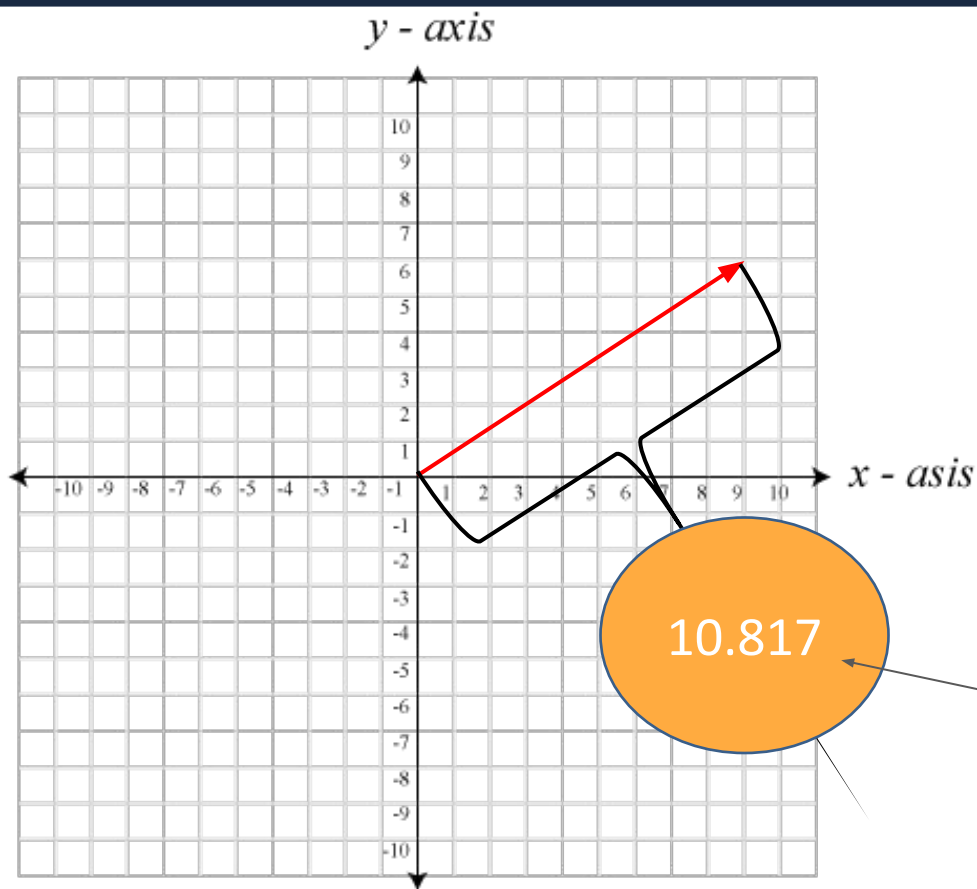

Scaling vectors

$$a = (3, 2)$$

$$a * 3$$

$$a * 3 = (3, 2) * 3 = (9, 6)$$

Vector Normalization

- A *unit vector* is a vector of length 1
- Our vector has length 10.817
- Directions usually needs unit vectors, how do we change a given direction (vector) to have length 1?
- -> normalization, pythagoras

the "magnitude"

Vector Normalization

Length of a is given by:

$$\sqrt{(x^2 + y^2)} = c$$

$$\text{Length of } a = \sqrt{(9^2 + 6^2)} = 10.867$$

Scale a by its inverse length = $a * 1/10.867$

$$\text{norm}(a) = a * 1/10.867$$

$$= (9, 6) / 10.687$$

$$= (0.84, 0.56)$$

Result is a vector of length 1.
With the same *direction* as a

There's More Important Vector Math!

Basic Vector Math

Unity Vectors

Working with Vectors in Unity

- Unity often uses 3d vectors
- The same math applies

Unity Vectors

Working with Vectors in Unity

In unity vectors and points are the same (we have no Point class):

```
Vector3 a = new Vector3 (3f, 6f, -1f);
```

The left hand rule

Unity Vectors

Working with Vectors in Unity

- Whether it's interpreted as a point or vector depends on its use:

```
Vector3 vec = new Vector3 (3f, 6f, -1f);
```

```
transform.position = vec;
```

```
rigidBody.velocity = vec;
```

```
transform.forward = vec;
```

If we set a velocity
(speed + direction),
it's a vector

If we set a direction,
it's a vector

If we set a
position, it's
a point:

Unity Vectors

Working with Vectors in Unity

Notice Vector3

```
Vector3 vec = new Vector3 (3f, 6f, -1f);
```

Scaling a vector

```
vec = vec * 3f;
```

Length of a
vector

```
float length = vec.magnitude;
```

Adding vectors

```
vec = vec + new Vector3 (1f, 3, 2f);
```

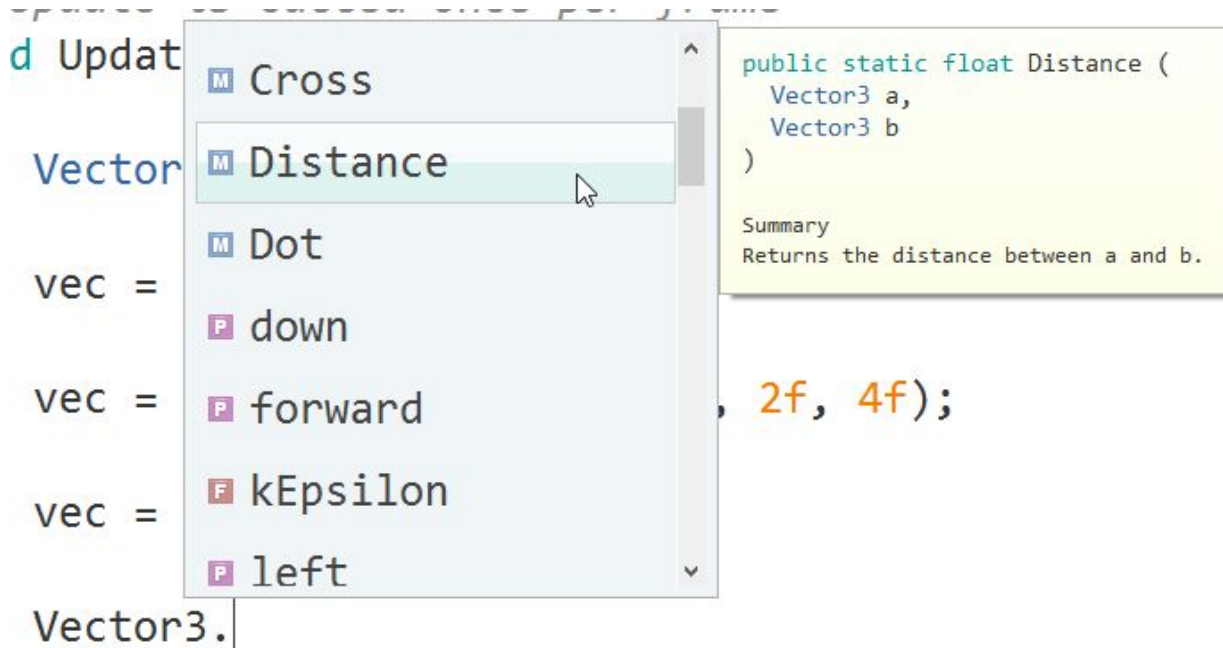

```
vec = vec.normalized;
```

Normalizing a vector. You
can also use .Normalize()

Unity Vectors

Working with Vectors in Unity

Your usual
auto-complete

Unity Vectors

Working with Vectors in Unity

Vector3.for

UnityEngine.Vector3

P forward

```
public static Vector3 forward { get; }
```

Summary

Shorthand for writing Vector3(0, 0, 1).

Vector3.lef|

UnityEngine.Vector3

P left

```
public static Vector3 left { get; }
```

Summary

Shorthand for writing Vector3(-1, 0, 0).

Unity Vectors

Working with Vectors in Unity

```
Vector3 forward = transform.for
```

UnityEngine.Transform

P forward

UnityEngine.Component

```
public Vector3 forward { get; set; }
```

Summary

The blue axis of the transform in world space.

Forward

Right

Up

Unity Rotations

Working with Vectors in Unity

```
transform.eulerAngles = new Vector3 (45f, 0f, 0f);
```

Linear Interpolation

Working with Vectors in Unity

Vector3.Lerp

UnityEngine.Vector3

M Lerp

M LerpUnclamped

```
public static Vector3 Lerp (  
    Vector3 a,  
    Vector3 b,  
    float t  
)
```

Summary

Linearly interpolates between two vectors.

Will return a vector t percent
between a and b

Linear Interpolation

Working with Vectors in Unity

```
Vector2 lerp = Vector2.Lerp(new Vector2(-7f, 8f), new Vector2(7f, 4f), 0.5f);
```

The result is a vector, *lerp* = (0f, 6f), i.e. half way between the two input vectors

Multiple Input Types

Basic Input

In most games, a user interacts with the game somehow:

- Keyboard
- Mouse
- Controller
- Something else..

Input

Basic Input

Always check for input in Update()

**VERY
IMPORTANT**

We get input from Unity's 'Input' class, using static methods

Input events are refreshed after each Update-call

Input are usually one of three events:

- Key is pressed down
- Key is held down
- Key is released

```
if (Input.GetKeyDown (KeyCode.Space)) {  
    Debug.Log ("Space is pressed");  
}  
if (Input.GetKey (KeyCode.Space)) {  
    Debug.Log ("Space is held down");  
}  
if (Input.GetKeyUp (KeyCode.Space)) {  
    Debug.Log ("Space is released");  
}
```

[Conventional Game Input](#)

Simple Controls

Basic Input

```
void Update () {  
    if (Input.GetKey (KeyCode.W)) {  
        transform.Translate (Vector3.forward * 5f * Time.deltaTime);  
    }  
    if (Input.GetKey (KeyCode.S)) {  
        transform.Translate ( -Vector3.forward * 5f * Time.deltaTime);  
    }  
    if (Input.GetKey (KeyCode.A)) {  
        transform.Rotate (Vector3.up, -50f * Time.deltaTime);  
    }  
    if (Input.GetKey (KeyCode.D)) {  
        transform.Rotate (Vector3.up, 50f * Time.deltaTime);  
    }  
}
```

Rotate around
an axis

Listening for Any Input

Basic Input

Notice the property, just a simplified get-method

```
void Update () {  
    string input = Input.inputString;  
    if(input != null && !"".Equals(input)) Debug.Log (input);  
}
```

The call 'Input.inputString' returns whichever key was pressed this frame.

Mouse Input

Basic Input

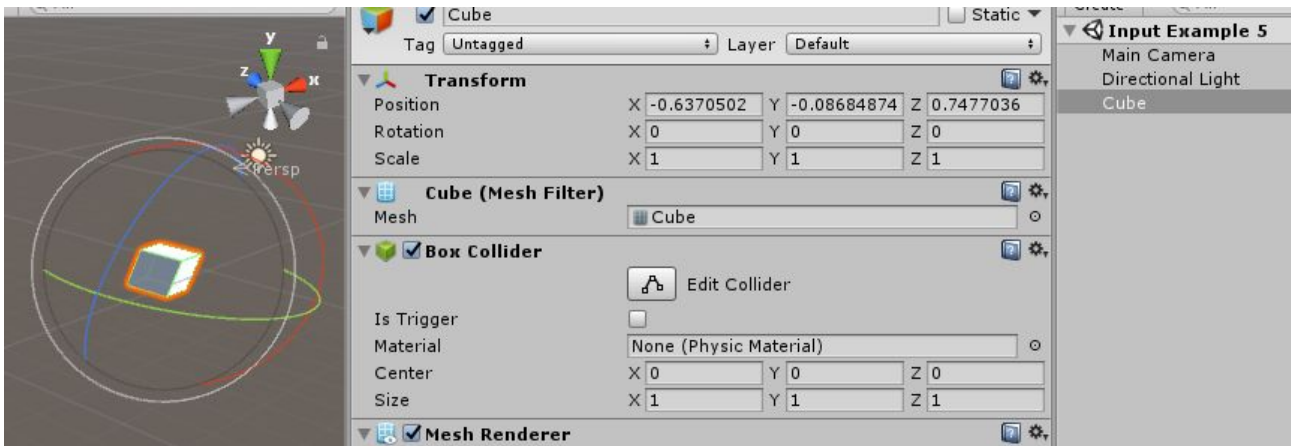

Sometimes we want to click objects

We can use MonoBehaviour event functions for this

The object we're clicking must have a collider

```
void OnMouseDown() {  
    Debug.Log ("Clicked");  
}
```

```
void OnMouseOver() {  
    Debug.Log ("Hover");  
}
```

Detecting mouse events

- `OnMouseDown`, `OnMouseEnter`, `OnMouseOver`, `OnMouseExit`
- Uses Colliders to register the hit

Detecting mouse position

- `Input.mousePosition`
- `Vector3` with `z` as `0.0`. The values are in pixels. `(0,0)` is the bottom left of your game window.
- Editor coordinates != Build coordinates

Mouse input as axis:

- `Input.GetAxis("Mouse X")`
- `Input.GetAxis("Mouse Y")`

Mouse Input

Basic Input

▼ Fire1

Name	Fire1
Descriptive Name	
Descriptive Negative Name	
Negative Button	
Positive Button	left ctrl
Alt Negative Button	
Alt Positive Button	mouse 0
Gravity	1000
Dead	0.001
Sensitivity	1000
Snap	<input type="checkbox"/>
Invert	<input type="checkbox"/>
Type	Key or Mouse Button
Axis	X axis
Joy Num	Get Motion from all Joysticks

UnityEngine.Input

- GetMouseButton
- GetMouseButtonDown
- GetMouseButtonUp

```
public static bool GetMouseButton (
    int button
)
```

Summary
Returns whether the given mouse button is held down.

```
if (Input.GetMouseButtonDown (0)) {
    Debug.Log ("Say hello");
}
if (Input.GetButtonDown ("Fire1")) {
    Debug.Log ("Other hello");
}
```

Mobile Input

Basic Input

Possibilities with a mobile device: Multi-touch, accelerometer, GPS, camera, microphone, compass, virtual keyboard, etc...

ALL MOUSE FUNCTIONALITY WORKS FOR TOUCH! :)

But if you want multi-touch functionality you have to use `Input.Touch(int)`, that stores all touches in an array.

Accelerometer:

```
transform.Translate(Input.acceleration.x, 0, -Input.acceleration.z);
```

GetKey vs GetButton

The Input Manager

- GetKey uses hardcoded key codes `Input.GetKey (KeyCode.W)`
- GetButton uses the Input Manager to handle inputs

We don't want to hardcode every button press through scripts. That's why it's good practice to use GetButton instead of GetKey.

```
void Update () {  
if (Input.GetKeyDown("space")) {  
    Debug.Log("Pressing space!");  
}  
  
if (Input.GetButtonDown("Jump")) {  
    Debug.Log("Also pressing space!");  
}  
}
```

Better!!

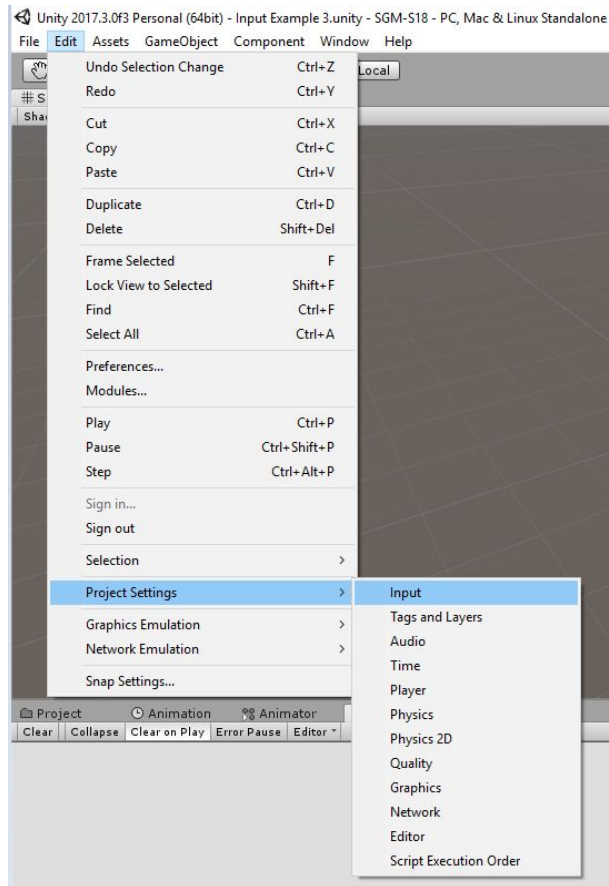

The input manager has two types:

- Buttons -> [true, false]
- Axes -> [-1, 1]

[GetButton and GetKey](#)

Input Manager

The Input Manager

Input Manager

The Input Manager

- Movement example from before
- Now “Vertical” references the “Vertical” axis from the Input Manager

```
void Update () {  
    float vertical = Input.GetAxis ("Vertical");  
    if (vertical != 0f ) {  
        transform.Translate (vertical * Vector3.forward * 5f * Time.deltaTime);  
    }  
  
    float horizontal = Input.GetAxis ("Horizontal");  
    if (horizontal != 0f) {  
        transform.Rotate (Vector3.up, 50f * Time.deltaTime * horizontal);  
    }  
  
    if (Input.GetButtonDown ("Jump")) { // teleport  
        transform.Translate (Vector3.forward * 3f);  
    }  
}
```

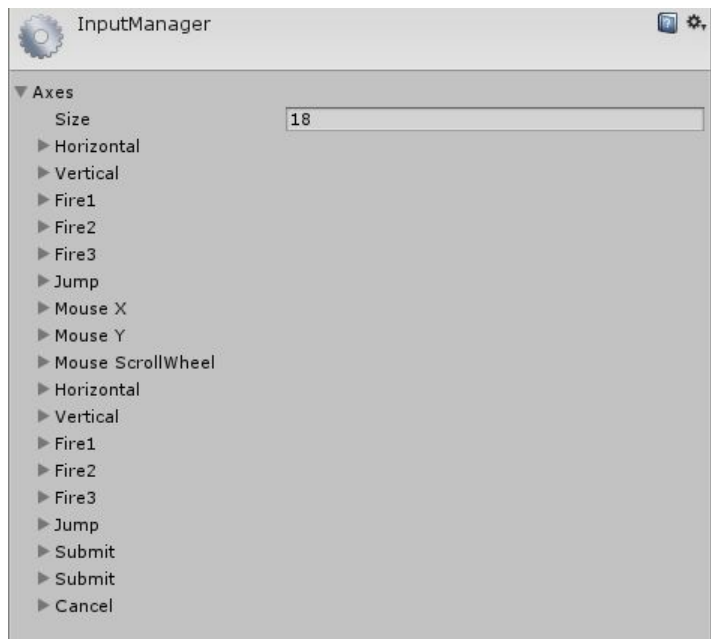

GetAxis returns a
float [-1, 1]

What's going on
here?

Input Manager

The Input Manager

- To modify the InputManager, change the '18' to a larger size, this will create more buttons for you to edit:

Input Manager, Axis Example

The Input Manager

▼ Axes

Size: 20

▼ Horizontal

Name: Horizontal

Descriptive Name:

Descriptive Negative Name:

Negative Button: left

Positive Button: right

Alt Negative Button: a

Alt Positive Button: d

Gravity: 3

Dead: 0.001

Sensitivity: 3

Snap: ☒

Invert: ☐

Type: Key or Mouse Button

Axis: X axis

Joy Num: Get Motion from all Joysticks

The reference name

Positive (and negative) buttons

When released, how fast do we go back to 0?

[-1, 1]

-1, 0, 1

```
float horizontal = Input.GetAxis ("Horizontal");
```

```
float horizontal = Input.GetAxisRaw ("Horizontal");
```

Input Manager, Button Example
